

# FORESTS **SUPPORT** PLANET EARTH

Our planet enables all things to live. It gives us oxygen to breathe, water to drink, soil for growing things, habitat to support biodiversity and places to be active. How does Earth do it?

Forests are essential for supporting our planet. Sustainable forests ensure the three other ecosystem services – provisioning, regulating and cultural – work in harmony, protecting and enhancing life as we know it.

**Care for your forests and  
they'll take care of you.**
